

2023 SYMPOSIUM

Mission Statement

To bring together conservation practitioners, researchers and educators who have an impact on the health of Florida's Coral Reef. The symposium will focus on research, tools and techniques for restoring and preserving Florida's Coral Reef and highlight coral conservation initiatives, formal and informal education, and public outreach.

Symposium Overview

This year, Frost Science will host the first-ever annual symposium specific to Florida's Coral Reef, highlighting new research, innovative conservation and educational efforts. The week-long event, taking place November 6th – 9th, will feature three main themes: scientific research, conservation and environmental education on Florida's Coral Reef. Symposium presenters and attendees will include researchers studying a variety of aspects of Florida's Coral Reef, educators that emphasize coral reef conservation in their messaging, and conservation practitioners who work at a variety of stakeholder groups, including non-profits, universities and governmental organizations.
